Soils and Fertilizers

Determining the solubility (activity) of certain carbonates rocks by microdialysis. A. M. Karpovics, B. Chilipalska, K. Vojnicka-Bedny, and C. G. L. Rasmussen. *Nauk. Rada Rzeczypospolitej Polskiej, Rocznik Nauk. Rolnictwa* 66, Ser. A, No. 3, 31-38 (in Russian 58-9; in English 59-60) (1953).—Carbonate rocks even of like texture and geological formation vary in their rates of soln. Among limestones, marls, and dolomite crushed to a particle size of 10 mm. the greatest rate of soln. was reached by chalk limestone, chalk, and chalk marl. Crushed limestones, e.g. chalk, tertiary lithotamnium, red Devonian, marble, Senonian marl, and Turonian marl, of particle size 0.25-0.5 mm., should be suitable as Ca fertilizers. Jurassic limestone, Devonian limestone, and dolomite of particle sizes 0.25-0.5 mm. would be slowly acting Ca fertilizers. The properties of rendzina and its agricultural value depend upon the activity and ability to crush the carbonate rock from which the rendzina was derived. E. G. J.

Chlipalski T. A New Remote-Control Heating System.

„Nowy system ogrzewania zdalczynnego". Gaz, Woda i Technika Sanitarna. No. 3, 1955, pp. 75—77, 4 figs.

In remote-control systems of heating hitherto existing, the pressure and temperature of the water distributed through the mains are confined within certain limits by the types of heat-producing and heat-receiving installations and, on the other hand, by economic factors. A new system of heating developed at the Institute of Heating and Ventilation Research, Silesian Higher Technical School, permits, if necessary, very high parameters of water and steam in the mains and any desired parameter of water in a domestic heating installation, the coupling being direct, without any intervening elements. The inner installation comprises the ordinary distribution mains and radiators and a special coupling connecting it with the external main. Hot water is directed into a mixer linked with the main. An essential feature of the system is the automatic movement of the water in the installation. This paper gives a description of the external return main and boiler room.

TITLE: Properties of the first Polish glassceramics

SOURCE: Szkło i ceramika, no. 2, 1964, 56-58

TOPIC TAGS: glassceramic, pyroceramic, pyroceram, devitrified glass, crystalline glass

ABSTRACT: The author explains what is meant by the term "glassceramic" or "pyroceramic" and describes the methods of preparation of these materials. Three examples of such materials made at the Glass Laboratory of the Institute of the Glass and Ceramic Industry were studied. The chemical compositions and various properties (mechanical, electrical, chemical) are tabulated, and compared with those of the corresponding glass and with those of porcelain. The very attractive properties displayed by the three types of glassceramics point to some very broad applications in various branches of technology. Examples of products which can be made of these materials are listed. Orig. art. has: 3 tables.

Figure 1 shows the required sizes for the manufacture of the test pieces.

Consequently, the *in vitro* test system can be used to predict the potential risk of a compound to cause teratogenic effects.

1930-1931. The following year, 1932, glass imports were  
estimated at 1,000 million dollars.

**ABSTRACT:** The suitability of slate for the manufacture of glass and its physical properties were determined in England during 1938-39. Experiments were carried out with various types of slate, and the results are given in Table I, of which Fig. 1 shows the variation of the melting point of slate with its particle size. The melting point of slate is dependent on the carbon content, and the latter is found to be higher when it is heated in air than when it is heated in nitrogen. The heat treatment of slate is discussed, and the effect of the particle size on the melting point during the heat treatment and subsequent cooling is also considered. The results are summarized for English slate.

TITLE: Automatic determination of the dependence of the ignition voltage of a glow-discharge tube on the duration of operation

PERIODICAL: Referativnyy zhurnal. Avtomatika i radioelektronika, no. 7, 1962, abstract 7-3-65 kh (Automatizace, v. 5, no. 1, 1961, 19-20 [in Czech])

TEXT: The ignition voltage of glow-discharge tubes undergoes particularly marked variations during their initial period of operation. In this connection, the technological manufacturing process of such valves includes ageing treatment, during which a current, higher than the maximum operating current, is passed through the valve. At this stage valves, in which the ignition voltage exceeds the permissible value owing to poisoning of air leakage, are rejected. An automatic measuring installation is described, in which facilities are provided for selecting the observation interval, for regulating the voltage and for a rapid voltage increase to the Card 1/2

1013. Magnetic recording of impulses. V  
Chlum. Sklaboprovod Obzor, 14, No. 6, 270-6  
(1953) In Czech.

The recording of impulses along a magnetic tape is considered. The magnetic field,  $H$ , in the vicinity of the recording gap is investigated both graphically and analytically. The minimum distance between two successive recorded pulses,  $T$ , is then calculated, on the basis of the above analysis, under the assumption that  $H = 0.1 H_{max}$  does not disturb the neighbouring pulse. The influence of permeability and thickness of tape, the hysteresis loop of the magnetic material and the pulse shape on the length of the recorded waveform is discussed, the conclusion being that  $T = v t + 13.5Z$  (for  $Z > g$ ) where  $v$  = the velocity of the tape;  $t$  = length of the pulse (before recording);  $Z$  = head-to-tape distance;  $g$  = recording gap length. The reproduction of the impulses is briefly discussed. The calculated values of  $H$  agree well with those measured by Muckenheim [see Abstr. 4337 (1951)].

1151. A time base for the study of monostable circuits. V. Cifra. Sladovny Obrn. 14,  
No. 7-8, 328 31 (1953) In Czech

The equipment described is suitable for the display and measurement of triggered or synchronized pulses of 1-20  $\mu$ sec duration. It consists of a free-running or triggered blocking oscillator working at 0.2-5 kev which drives a monostable cathode-coupled multivibrator (c.c.m.); the latter generates rectangular pulses of 1-14  $\mu$ sec whose leading edge is used to trigger a second c.c.m. and the trailing edge to drive the circuit under investigation. The positive pulses from the second c.c.m. are applied to the control grid of the c.r.t., while the negative ones drive a sweep generator. The device contains also a pulsed oscillator working at 1 Mc/s which is used for the time measurements. Detailed circuit diagrams of the equipment and some oscillograms are given.

A switching matrix for commutation of the heads of a magnetic-drum memory

## PERIODICAL:

Referativnyy zhurnal, Avtomatika, telemekhanika i vychislitel'naya tekhnika, no. 1, 1963, 40, abstract 1B222 (Czech pat., cl. 42 m, 14, no. 99010, Mar. 15, 1961)

## TEXT:

The patent covers a design of switching elements for commutation of the heads of a magnetic drum. Each such element consists of a transformer whose secondary has a center-tap, to which the output of the recording amplifier is connected. The two ends of the winding are connected through diodes to two busses which are connected with an electronic rectifier. These same busses are connected through a symmetrizing resistor network to the input of the reproducing amplifier. During recording, current pulses of various polarity are induced in the windings of the transformer.

AUTHOR: Chlouba, Vaclav (Khlouba, Vatslav)

TITLE: Magnetic drum store of the EPOS 1 computer

SOURCE: Ceskoslovenska akademie ved. Vyzkumny ustav matematickych stroju. Stroje na zpracovani informaci, no. 9, 1963, 41-58

TOPIC TAGS: computer component, computer circuit, magnetic core storage, memory core, memory time

ABSTRACT: The general design and some technical features of the EPOS 1 medium magnetic drum memory are analyzed to demonstrate the reasons for the choice of a standard EPOS combination of a high-speed ferrite memory (1000-word capacity) with a drum memory (capacity about 10000 words) permits high speed without excessive programming difficulties. Because a series-parallel address pattern is used, the magnetic heads are arranged in groups of five. The connection between individual groups and the recorder amplifiers is effected by means of switching matrices assembled on the semiconductor diodes. Individual memory cells on the

Card 1/2

ACCESSION NR: AT4040380

drum surface are selected by signals recorded on the drum auxiliary bands. The number of addresses is first recorded on these bands so that any number of successive memory cells can be read without interruption. The memory store is block-like in structure. For 64 bits and a capacity of 10000 words, the whole memory installation has 670 tubes, 3500 diodes, and a power demand of 7.6 Kva. For each additional 5000 words, another 110 tubes, 400 diodes, and .08 Kva power are required. Work on the magnetic drum memory was begun in 1958, and it is now in operation. A future report by the author will give the results of experience. "...Docent Dr. Antonin Svoboda and Grad. Eng. Jan Oblonsky were authors of the EPOS design and of the drum unit. Oblonsky was also the coauthor of the circuit principle. Aritma-Plant 04 worked out the construction of the drum. Vl. Richter and H. Svoboda took part in developing the magnetic heads and the electronic switches." Orig. art. has: 7 graphics.

TITLE: An analogue digital converter

PERIODICAL: Referativnyy zhurnal, Avtomatika i radioelektronika,  
no. 3, 1962, abstract 3-1-122 1 (Chekhosl. pat., kl.  
42m, 14, 21c, 46/54, no. 96820, 15.10.60)

TEXT: Patent of an analogue digital converter of the type "displacement (length) - digit", intended for use in metal-working machines, for control of a cutter displacement (or other instrument), or of a table with reinforced components. The essence of the invention lies in application of a special inductive transmitter consisting of two strips side by side, on to which are wound bifilar windings. One of the strips, being also longer, is stationary, the other and shorter is fixed to the shifting part of the machine. An h.f. signal generator is connected to the windings of the longer strip. When the short strip is displaced, pulses are generated across its winding at the time when its turns cut the turns of the

Card 1/2

An analogue digital converter

S/194/62/000/003/008/066  
D230/D301

longer stationary strip. After detection, these pulses are applied to a computer used for the working control of the machine etc. In order to improve the working accuracy of the converter, the moving and the stationary windings are arranged on two strips each. Stationary windings are made in sections, the distance between the sections being equal to the length of the moving windings. The stationary windings are displaced with respect to each other by the spacing between the sections. The accuracy of the converter can be further improved by using thin wires for the coils. 3 references. [ Abstracter's note: Complete translation.]

Abstract: The article describes psychoses with a phasic course,  
different from classical endogenous psychoses. A case report is  
presented illustrating the lack of unity in the diagnosis in  
conditions, that are usually included in various nosological  
groups. This undesirable disunity may be avoided to some extent  
by distinguishing a special nosological group of cycloid psy-  
choSES. This would also facilitate research in aetiology and  
the therapy of the psychoses.

TITLE: Further results in the treatment of psychoses with intermittent doses of reserpine [This paper was presented at the 7th Annual Psychopharmacological Meeting, Jesenik, 20-23 January 1965.]

SOURCE: Activitas nervosa superior, v. 7, no. 3, 1965, 253-254

TOPIC TAGS: tranquilizer, psychoneurotic disorder, drug treatment

ABSTRACT: Results of intermittent administration of reserpine to 45 women are described. 24 suffered from depressions, 9 from cycloid psychoses, and 12 from schizophrenia. Of the 24 patients with endogenous depressions, 15 became well enough to be discharged, 6 improved, and in 3 there was no change. The results correspond to those achieved with other antidepressants. Of the 9 cycloid patients, 7 were cured, but 2 developed acute schizoid symptoms. Of the 12 schizophrenics, only 3 improved. [Orig. art. in Eng.] [JPRS]

TITLE: Treatment of depressive states with infusions of Nialamid [This paper was presented at the 7th Annual Psychopharmacological Meeting, Jesenik, 20-23 January 1965]

22

SOURCE: Activitas nervosa superior, v. 7, no. 3, 1965, 294-295

TOPIC TAGS: drug treatment, psychoneurotic disorder, psychotherapy

ABSTRACT: Nialamid infusions were used in 20 hospitalized patients. All suffered from various forms of depression. 45% of the patients had a feeling of relaxation after the infusion, and were suitably disposed for psychotherapeutic treatment. The number of patients who improved by the treatment was very small. The best way of using Nialamid is to combine it with electroshock treatment. [Orig. art. in Eng.]

TITLE: Therapeutic use of triphenidyl in hypochondria [This paper was presented at the 7th Annual Psychopharmacological Meeting, Jesenik, 20-23 January 1965.]

SOURCE: Activitas nervosa superior, v. 7, no. 3, 1965, 296-297

TOPIC TAGS: drug treatment, psychoneurotic disorder

ABSTRACT: Experience with 31 female patients treated at the author's hospital is described. High doses caused frequent and strong side effects. 19 patients improved, 10 improved partly, and 2 showed no change. In some cases cycloid psychosis hypochondria was replaced by a paranoid picture. Because of the difficulties in treating hypochondriac patients, the results are encouraging and warrant further tests of triphenidyl. [Orig. art. in Eng.] [JPRS]

TITLE: Comparison of the therapeutic effect of some psychotropic drugs in neuroses  
[This paper was presented at the 7th Annual Psychopharmacological Meeting, Jesenik,  
20-23 January 1965]

SOURCE: Activitas nervosa superior, v. 7, no. 3, 1965, 301-302

TOPIC TAGS: tranquilizer, psychoneurotic disorder

ABSTRACT: 5 years of the authors' experience with drugs is reported.  
Meprobamate and Librium are used most frequently and successfully.  
Melleril approached the effect of the first two; Trioxazine gave weak results.  
Guajacuran did not show satisfactory results. Dichlorpromazine induced too many side effects.Ritalin was used to activate the symptoms in order to determine possible  
endogenous components. Application of tranquilizers is discussed. [Orig. art.

"A Clinical Comparison of a Placebo, Diazepam, and Diazepoxide  
at Short-Time Application in Neuroses."

Prague, Activitas Nervosa Superior, Vol 8, No 4, Nov 66, pp  
438 - 439

Abstract: A comparison between diazepoxide (Librium Roche) and diazepam (Valium) was made in an investigation conducted on 37 hospitalized patients ( 20 neurasthenias, 12 depressive neuroses, 4 anxious neuroses, and 1 mixed neurosis). 10 mg of Valium and 30 mg of Librium were used as one dose. An improvement was achieved with both drugs, but a deterioration occurred with the placebo. Valium acts better on neuroses than librium. The anxiolytic effect of both drugs was the same. No references. Submitted at the 8th Psychopharmacological Meeting at Jesenik, 18 - 22 Jan 66. Article is in English.

"A Comparison of the Therapeutic Effect of Meprobamate Administered in its Current Form and as an Unknown Drug."

Prague, Activitas Nervosa Superior, Vol 8, No 4, Nov 66, p 440

Abstract: The authors compared meprobamate in its original package to meprobamate labelled as Depresin and found, that while 25 patients out of 40 who received the drug considered Depresin better, only 5 considered meprobamate a better drug. 10 patients considered the drugs equal. It appears that meprobamate, because of its wide-spread use, loses its effectiveness because of popular prejudice against well-known drugs. No references. Submitted at the 8th Annual Psychopharmacological Meeting at Jelenik, 18 - 22 Jan 66. Article is in English.

Prague, Casopis Lekaru Ceskych, Vol 105, No 48, 2 Dec 66, pp  
1310 - 1315

Abstract /Authors' English summary modified/ Between 1957 and  
1964, 17 patients with primary carcinoma of the liver were studied  
clinically, and a verification of the diagnosis was made by post  
mortem examination. An exact clinical diagnosis verified by  
laparoscopy and biopsy was established in 2 cases, in 5 other  
cases a primary tumor was suspected after a comprehensive clinical ex-  
amination. Clinical aspects and possibility of diagnosis of  
the disease are discussed. 3 Figures, 3 Tables, 15 Western, 10  
Czech references. (Manuscript received Apr 66).

A severe acute industrial intoxication by trichloroethylene.  
Z. Bardotčí, J. Chlumský, and M. Krivucová (Lékařská  
fak. hyg., Prague). Časopis Lékařů Českých 94, 1001-8  
(1955).—Topical neurological symptoms lasted for 2 months  
after admission, showing disperse lesions in the central  
nervous system. Pos. Takata-Ara and Gross' reactions  
and thymol turbidity tests suggested an unspecific hepatic  
lesion. Concentration of trichloroethylene in the atm. was detd.  
by absorption into pyridine and a colorimetric modification  
of the Fujiwara reaction and was 0.2-5 mg./l. Phosgene  
was absent. Concentration of  $\text{Cl}_3\text{CCO}_2\text{H}$  in urine, when plotted  
in log scale against time, did not yield a straight line. A  
modification for its estn. is reported. Reducing substances  
in the urine showed a max. concn. on the 4th-5th day.  
Trichloroethanol was detected following oxidation.

6776. CHLUMSKÝ J. Intern. Klin. Lék. Hyg. Fac. KU, Praha, \*Pokus o kausální terapii stěhovavého zánětu žilního a Winiwarterovy-Bürgerovy obliterující thromboangitidy. Attempt at a causal treatment of the migrating venous inflammation in Winiwarter-Bürger's obliterating thromboangiitis. ČAS. LÉK. ČES., 1955, 94/49 (1364-1366)

As penicillin and streptomycin remained without effect in these 2 cases, a prolonged i.v. infusion of ACTH was administered. After some days a regression of the venous process could be observed. A permanent remission was obtained. The pathogenesis of Bürger's disease in connection with collagenous diseases is discussed as well as the action of ACTH in the initial stages of the disease and the possibility to influence its course and prognosis. The simultaneous administration of antibiotics (especially in patients with positive blood culture) is recommended.
